Introduction

The main effect on snow cover creation:

- accumulated in the mountains
- great impact of the wind
- spatial distribution of the snow cover

The main effect on snowmelt:

- spatial distribution of the snow cover
- orientation

• For a more detailed examination of these phenomena, we have built a measuring network in the Sokolný creek catchment in the Western Tatras

J. Hydrol. Hydromech., 64, 2016, 4, 316–328
DOI: 10.1515/johh-2016-0038

Experimental measurements for improved understanding and simulation of snowmelt events in the Western Tatra Mountains

Pavel Krajčí*, Michal Danko, Jozef Hlavčo, Zdeněk Kostka, Ladislav Holko

Thesis

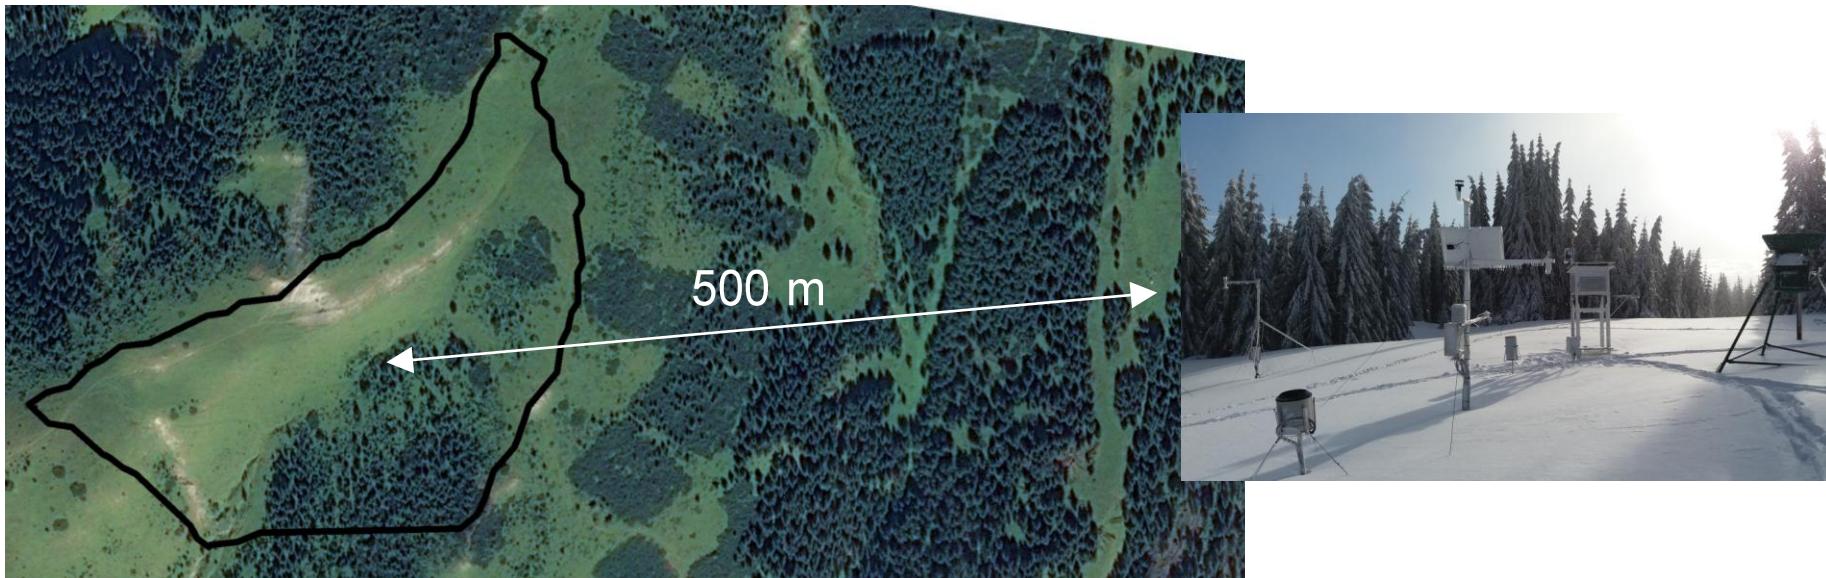

1. Spatial and temporal variability of the snow cover

- Winter 2015, 2016, 2017
- Duration of stable snow cover
- Differences between open area and forested part in the catchment

2. Modeling the spatial and temporal distribution of the snow by model Mike SHE

- Map of spatial distribution of the snow cover
- Compare simulations and measurements
- Snowmelt

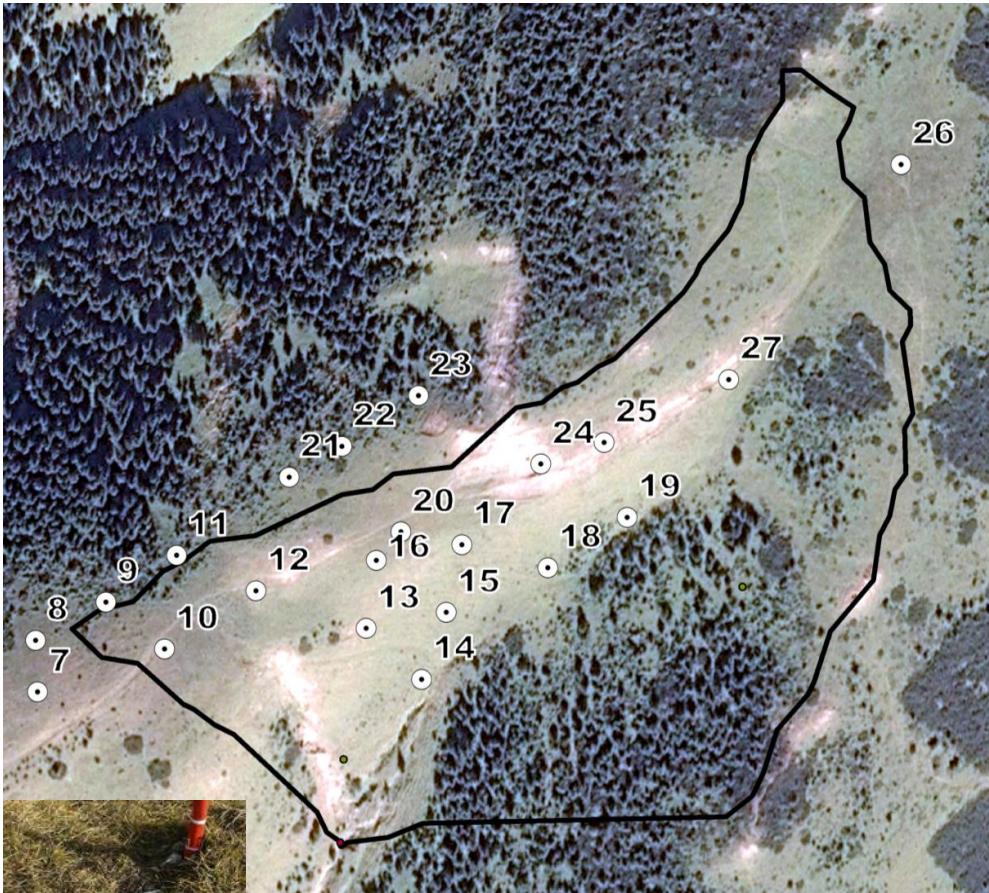

Sokolný creek catchment

- since 2014
- area 0,056 km²
- Min. altitude 1440 m asl.
- Max. altitude 1566 m asl.
- Forested part 39%
- Geology: Limestone and dolomite
- Grassland and young forest
- Data for Sokolný creek catchment
- Automatic Meteorological Station
- 500 meters nearby catchment
- Air temperature
- Precipitation (only 2015)
- Wind
- Snowscale
- Global radiation

Winter 2015

- 13 Snow stakes at open area for measurements of the snow
- 7 surface thermometers in open area and two in forested part in the catchment (*duration of stable snow cover*)

- 3 lysimeters

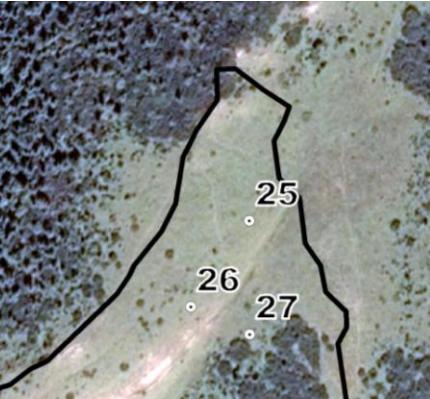

- GPS measurements
- Soil moisture measurements

Winter 2016, 2017

- 2 weighing rain gauge

- 19 Snow stakes at open area
- 6 Snow stakes in forest
- 19 surface thermometers in open area and 6 in forested part in the catchment (*duration of stable snow cover*)

- GPS measurements

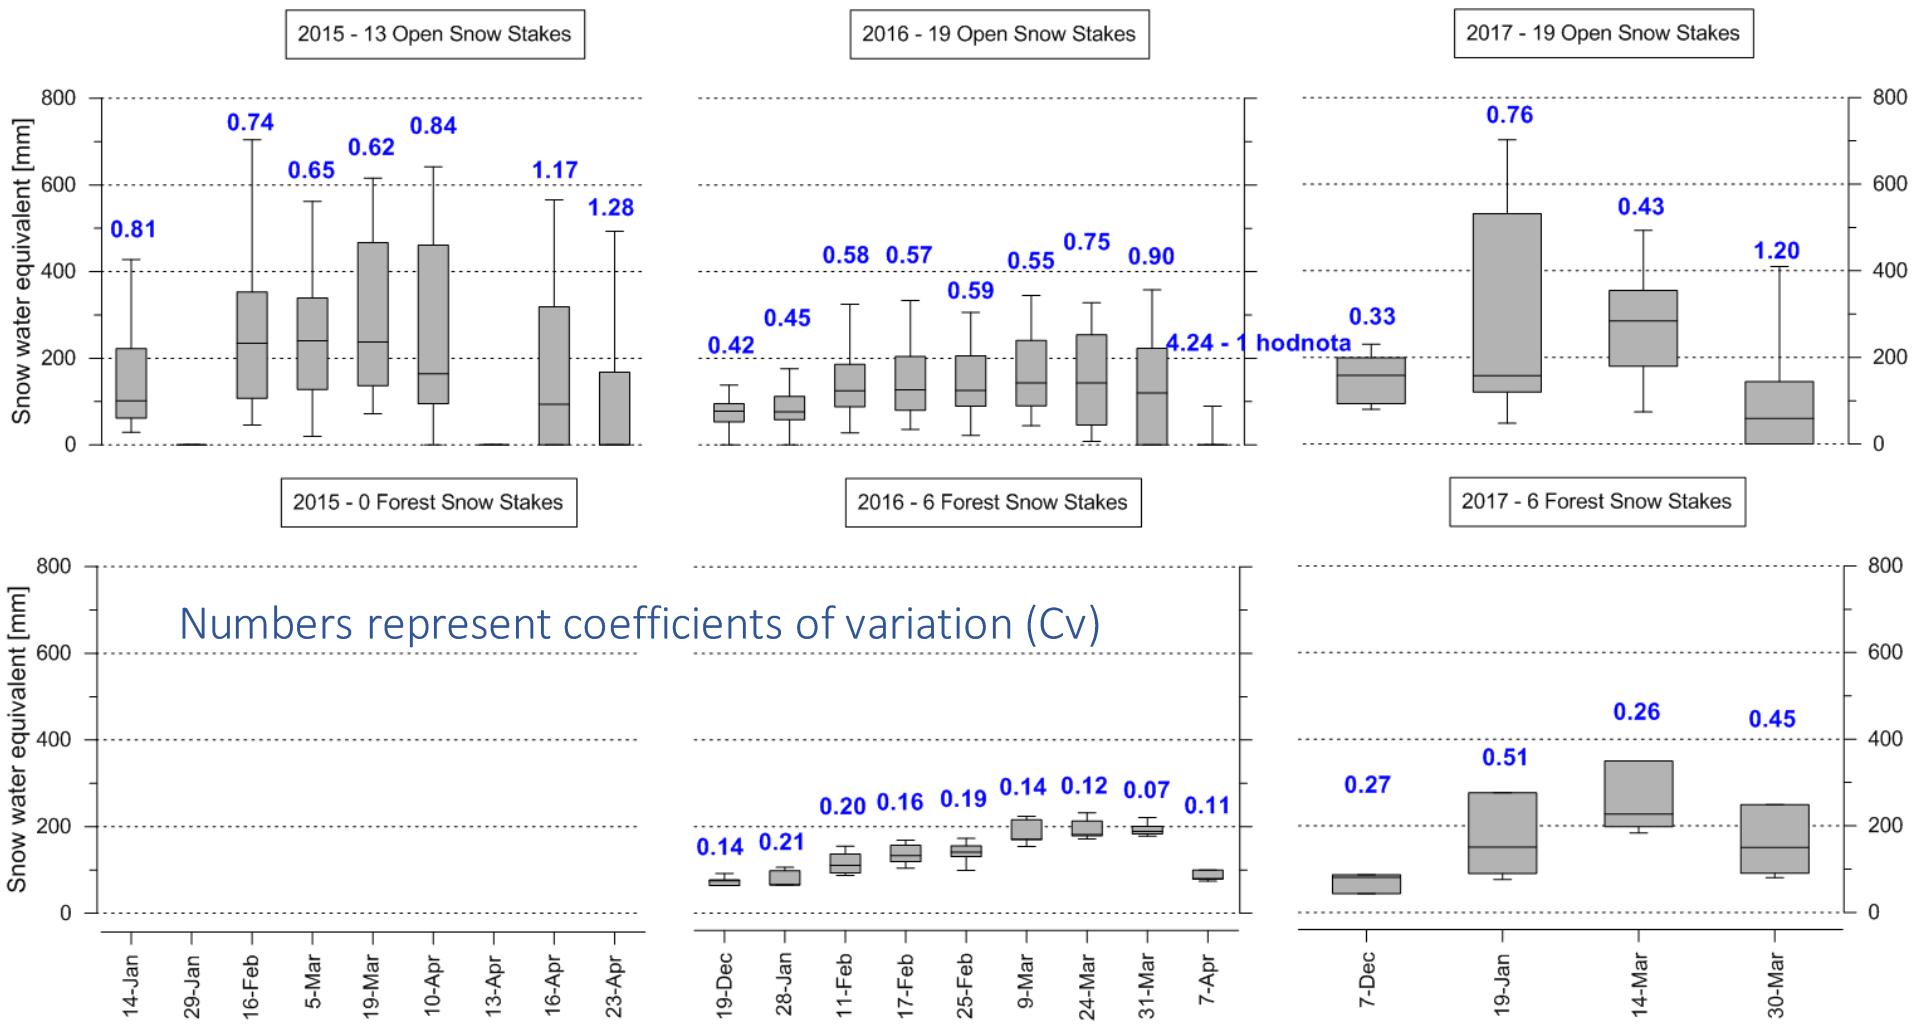

- 9 lysimeters

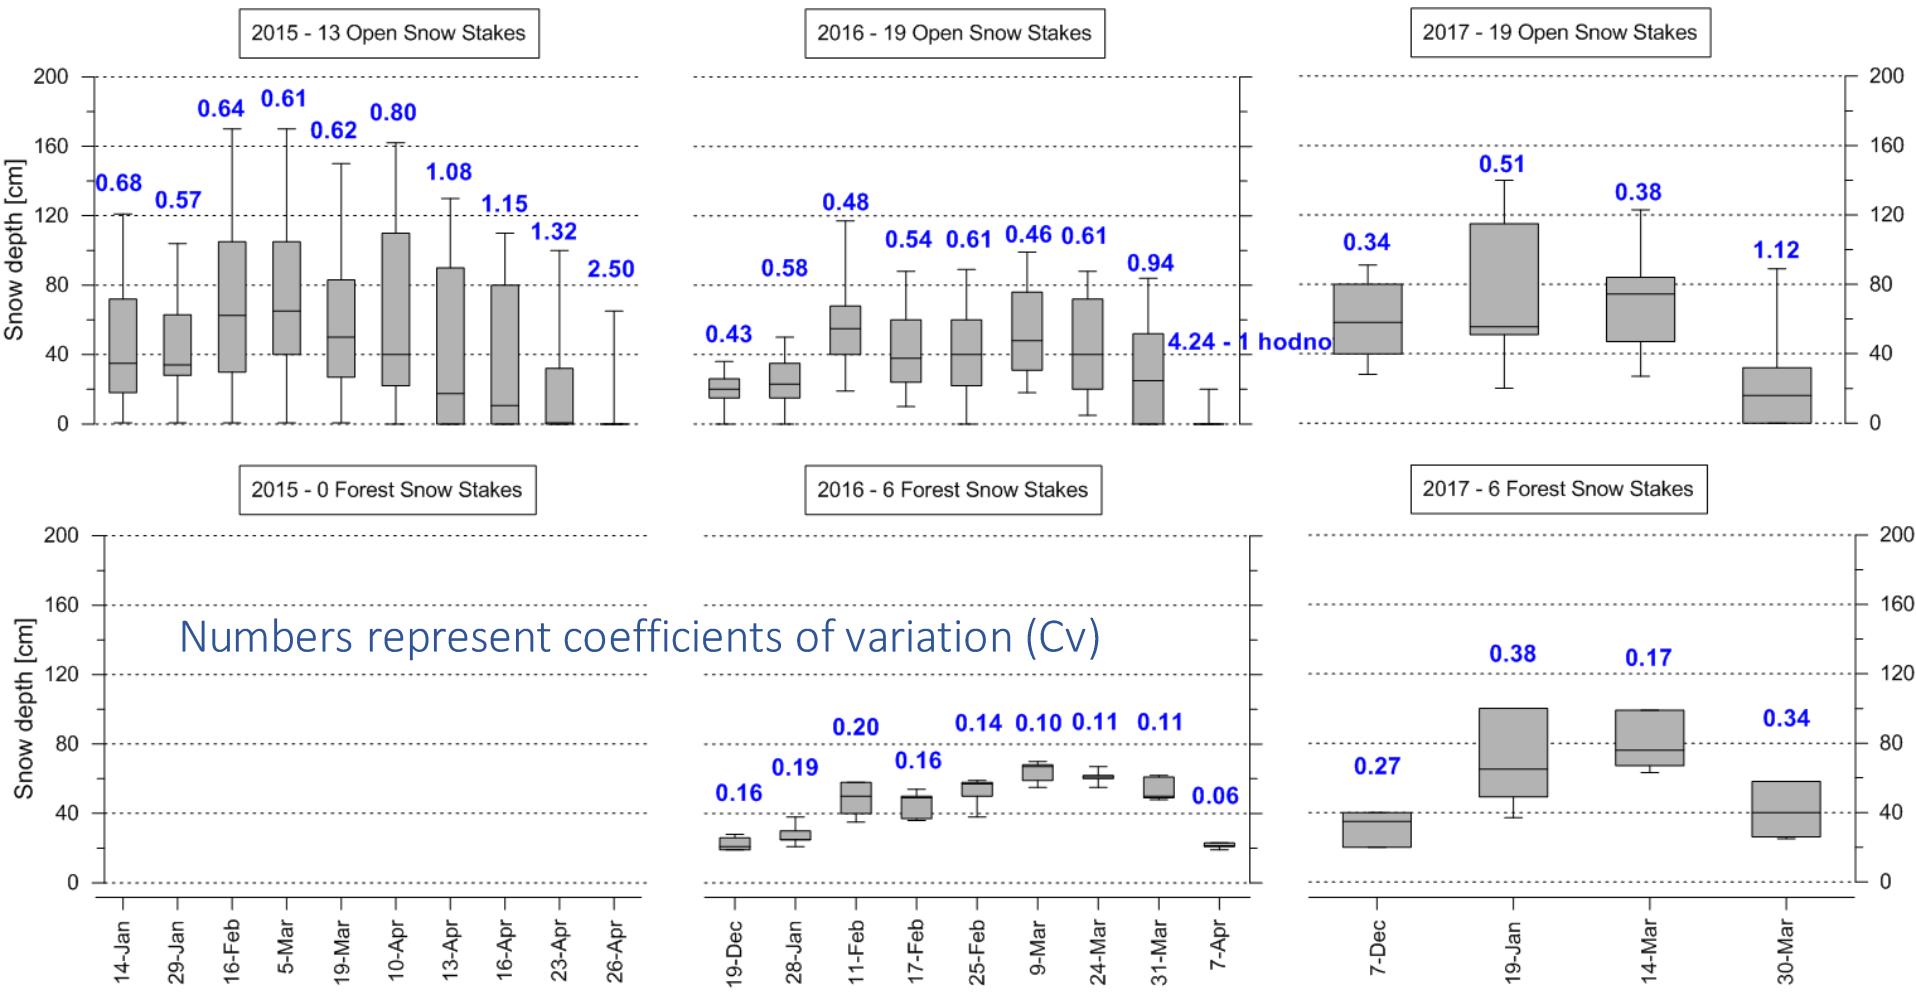

- Soil moisture measurements

Spatial and temporal variability of snow water equivalent (SWE) in Winter 2015 -2016 - 2017

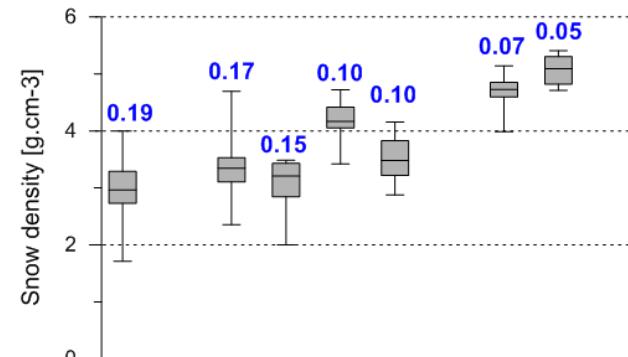

Spatial and temporal variability of snow depth 2015 – 2016 - 2017

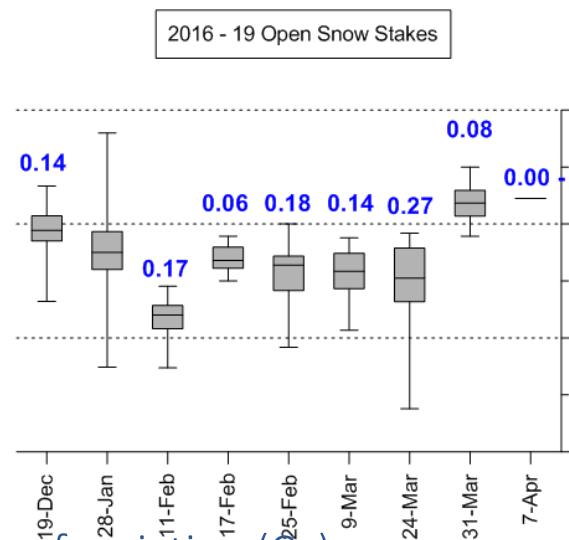

Spatial and temporal variability of snow density 2015 – 2016 - 2017

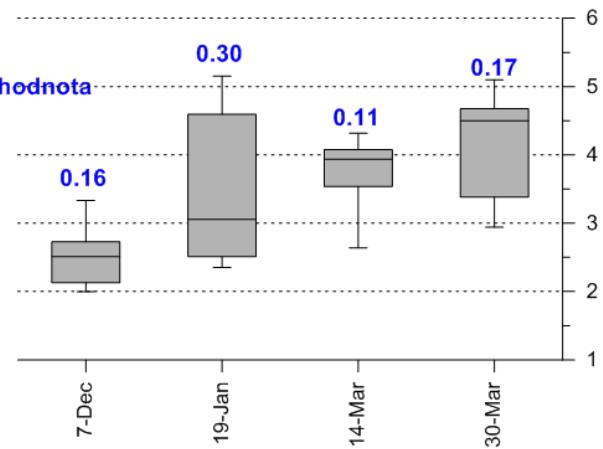

2015 - 13 Open Snow Stakes

2016 - 19 Open Snow Stakes

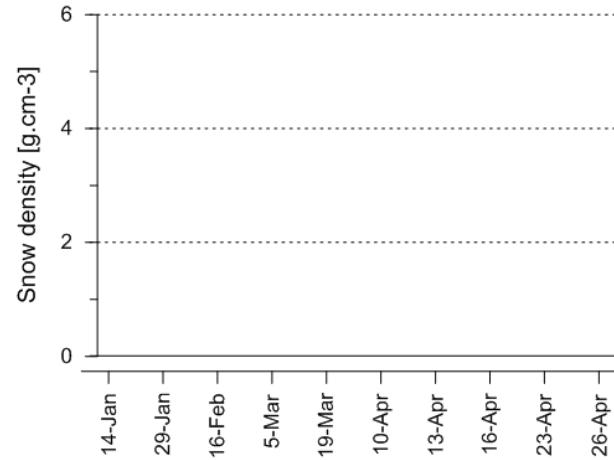

2017 - 19 Open Snow Stakes

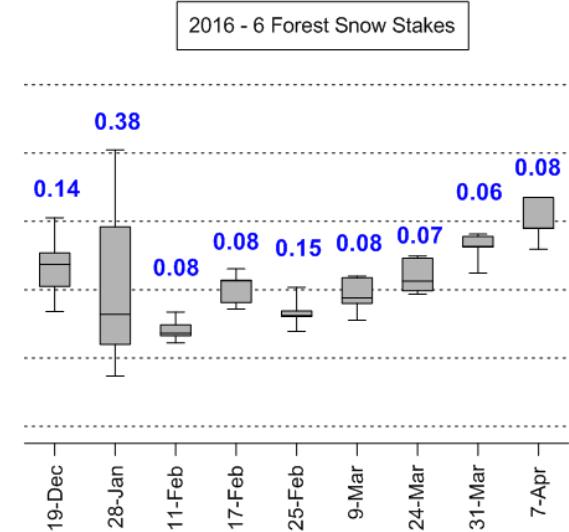

Numbers represent coefficients of variation (Cv)

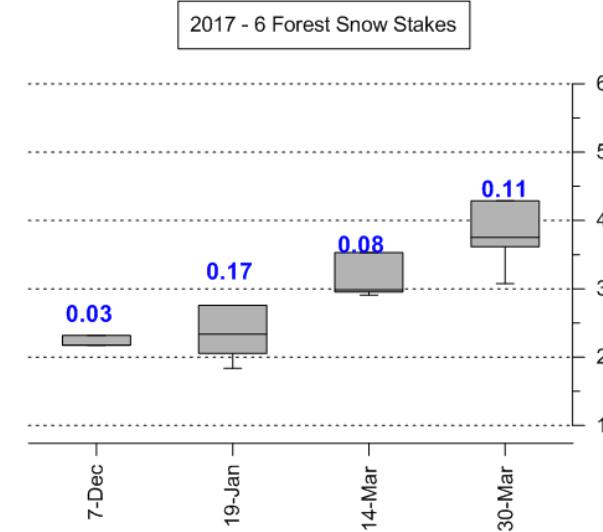

2015 - 0 Forest Snow Stakes

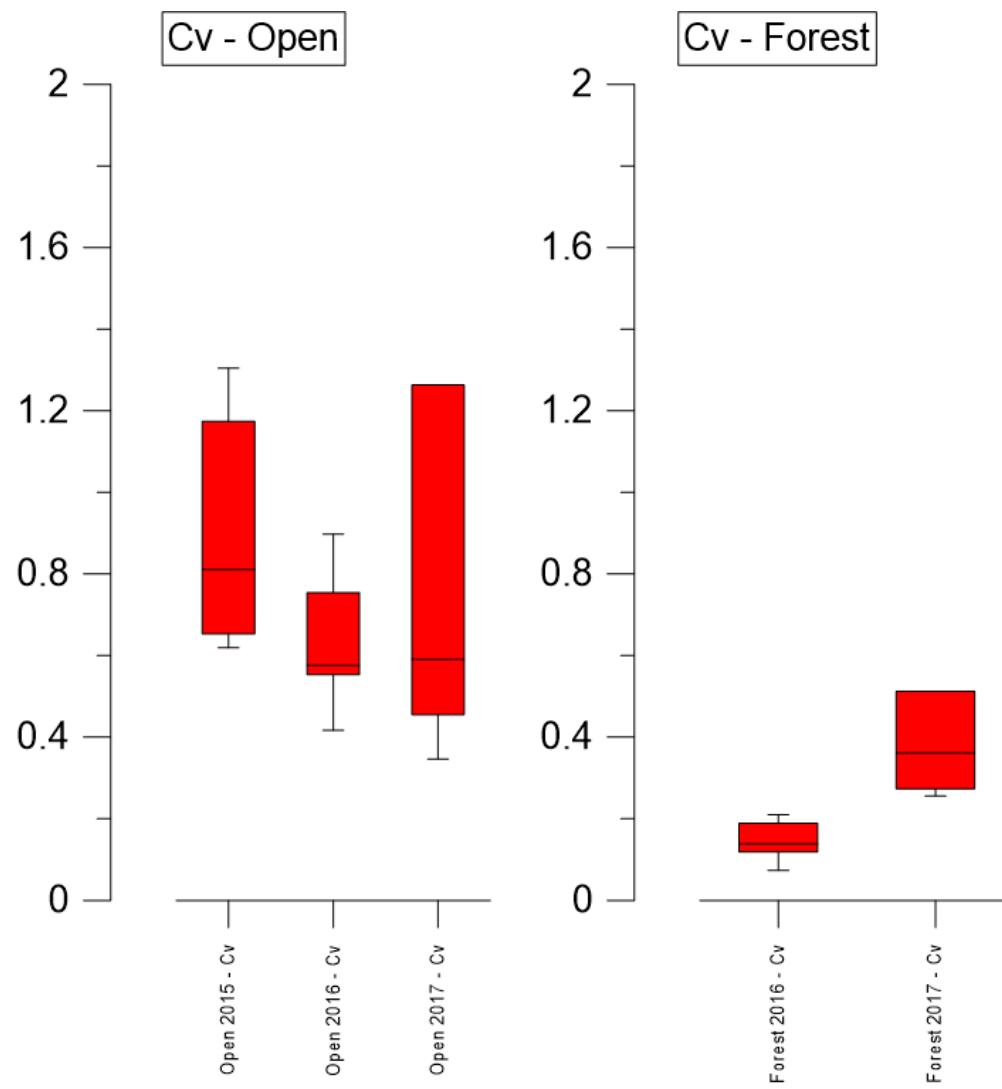

2016 - 6 Forest Snow Stakes

2017 - 6 Forest Snow Stakes

Coefficients of variation in open area and the forest (SWE)

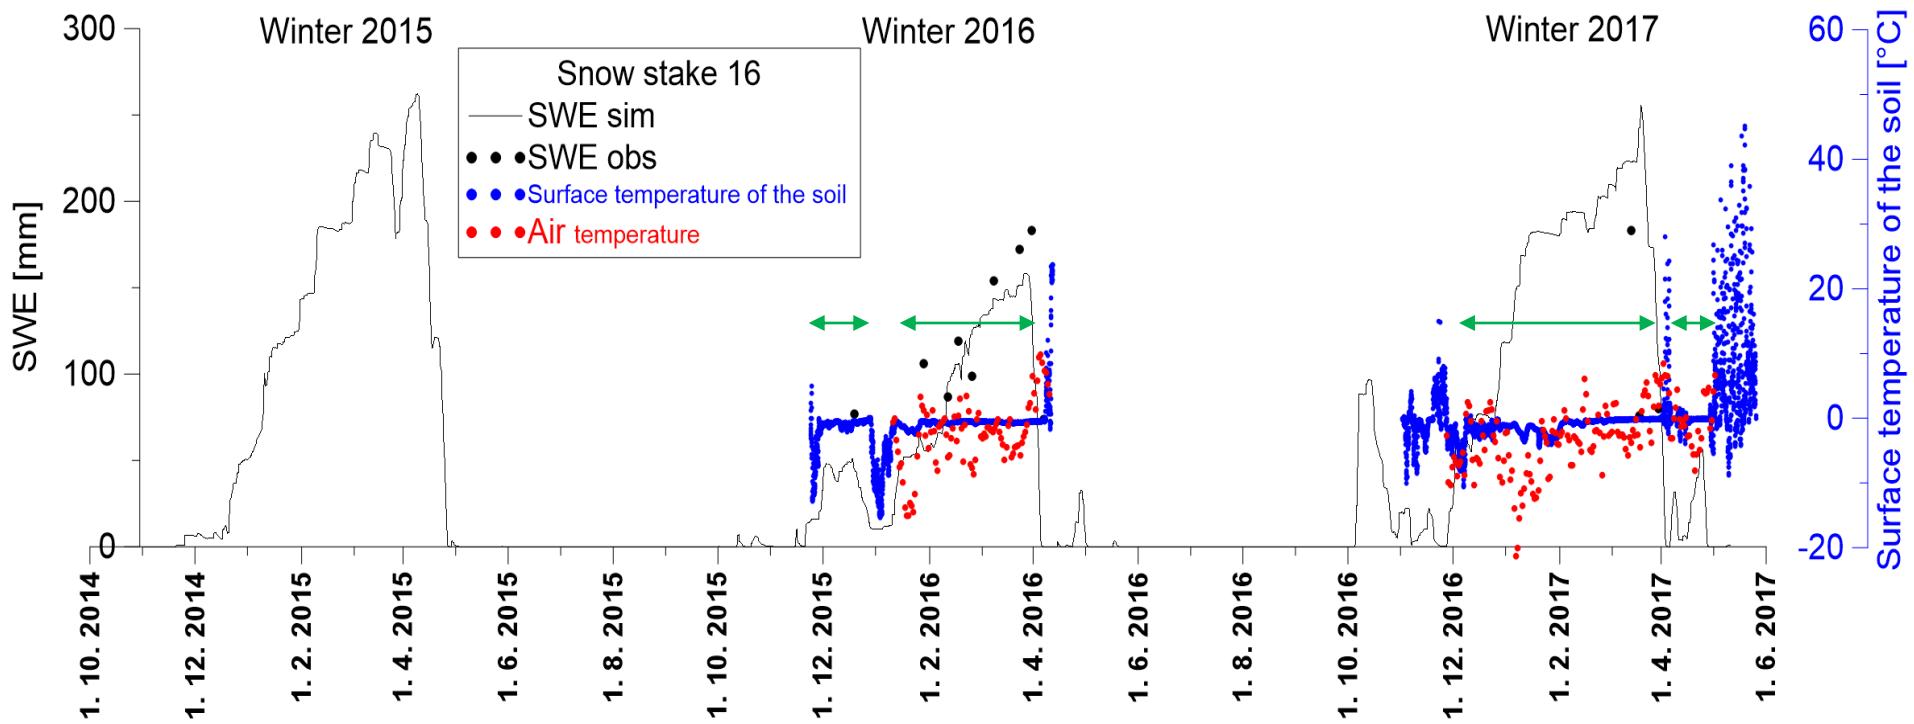

Duration of stable snow cover

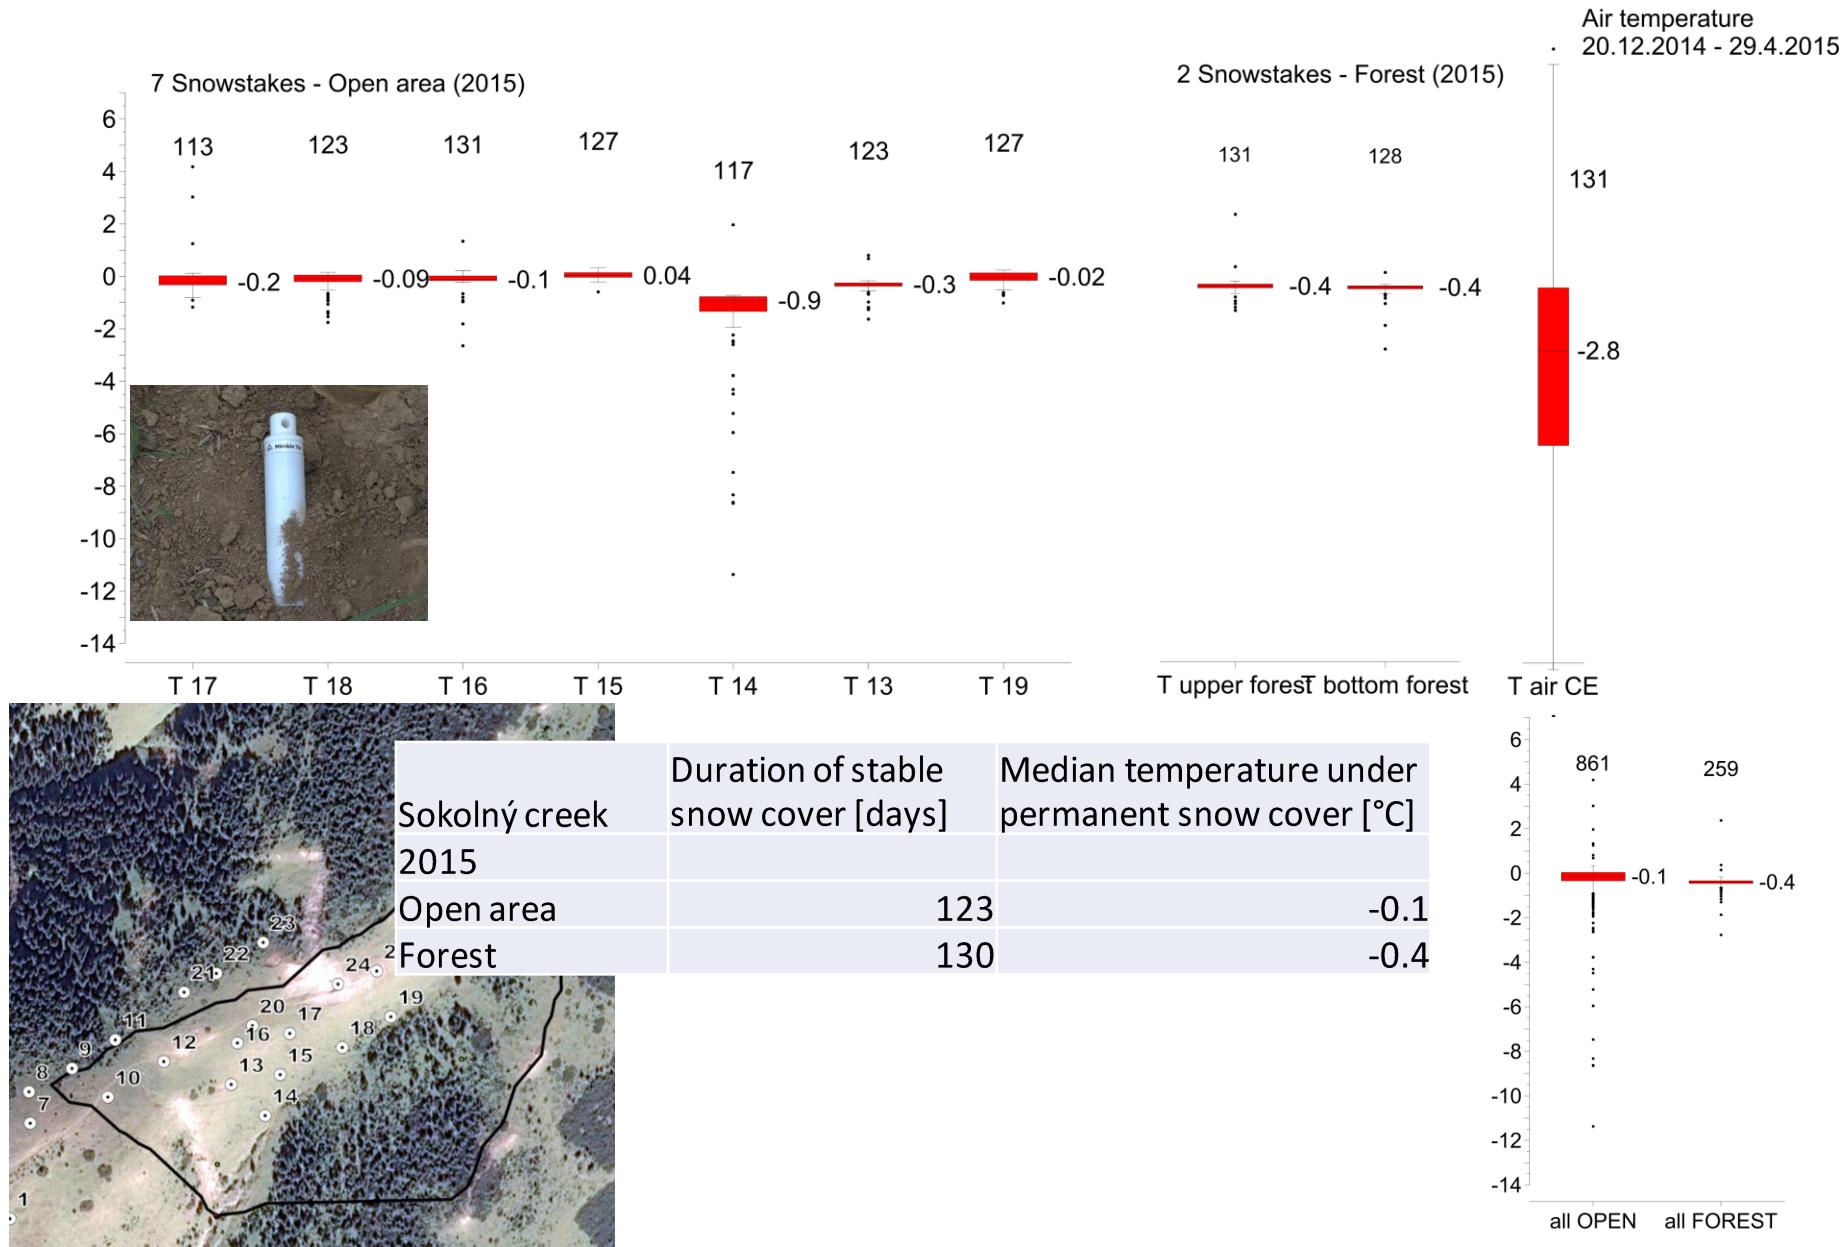

For example:

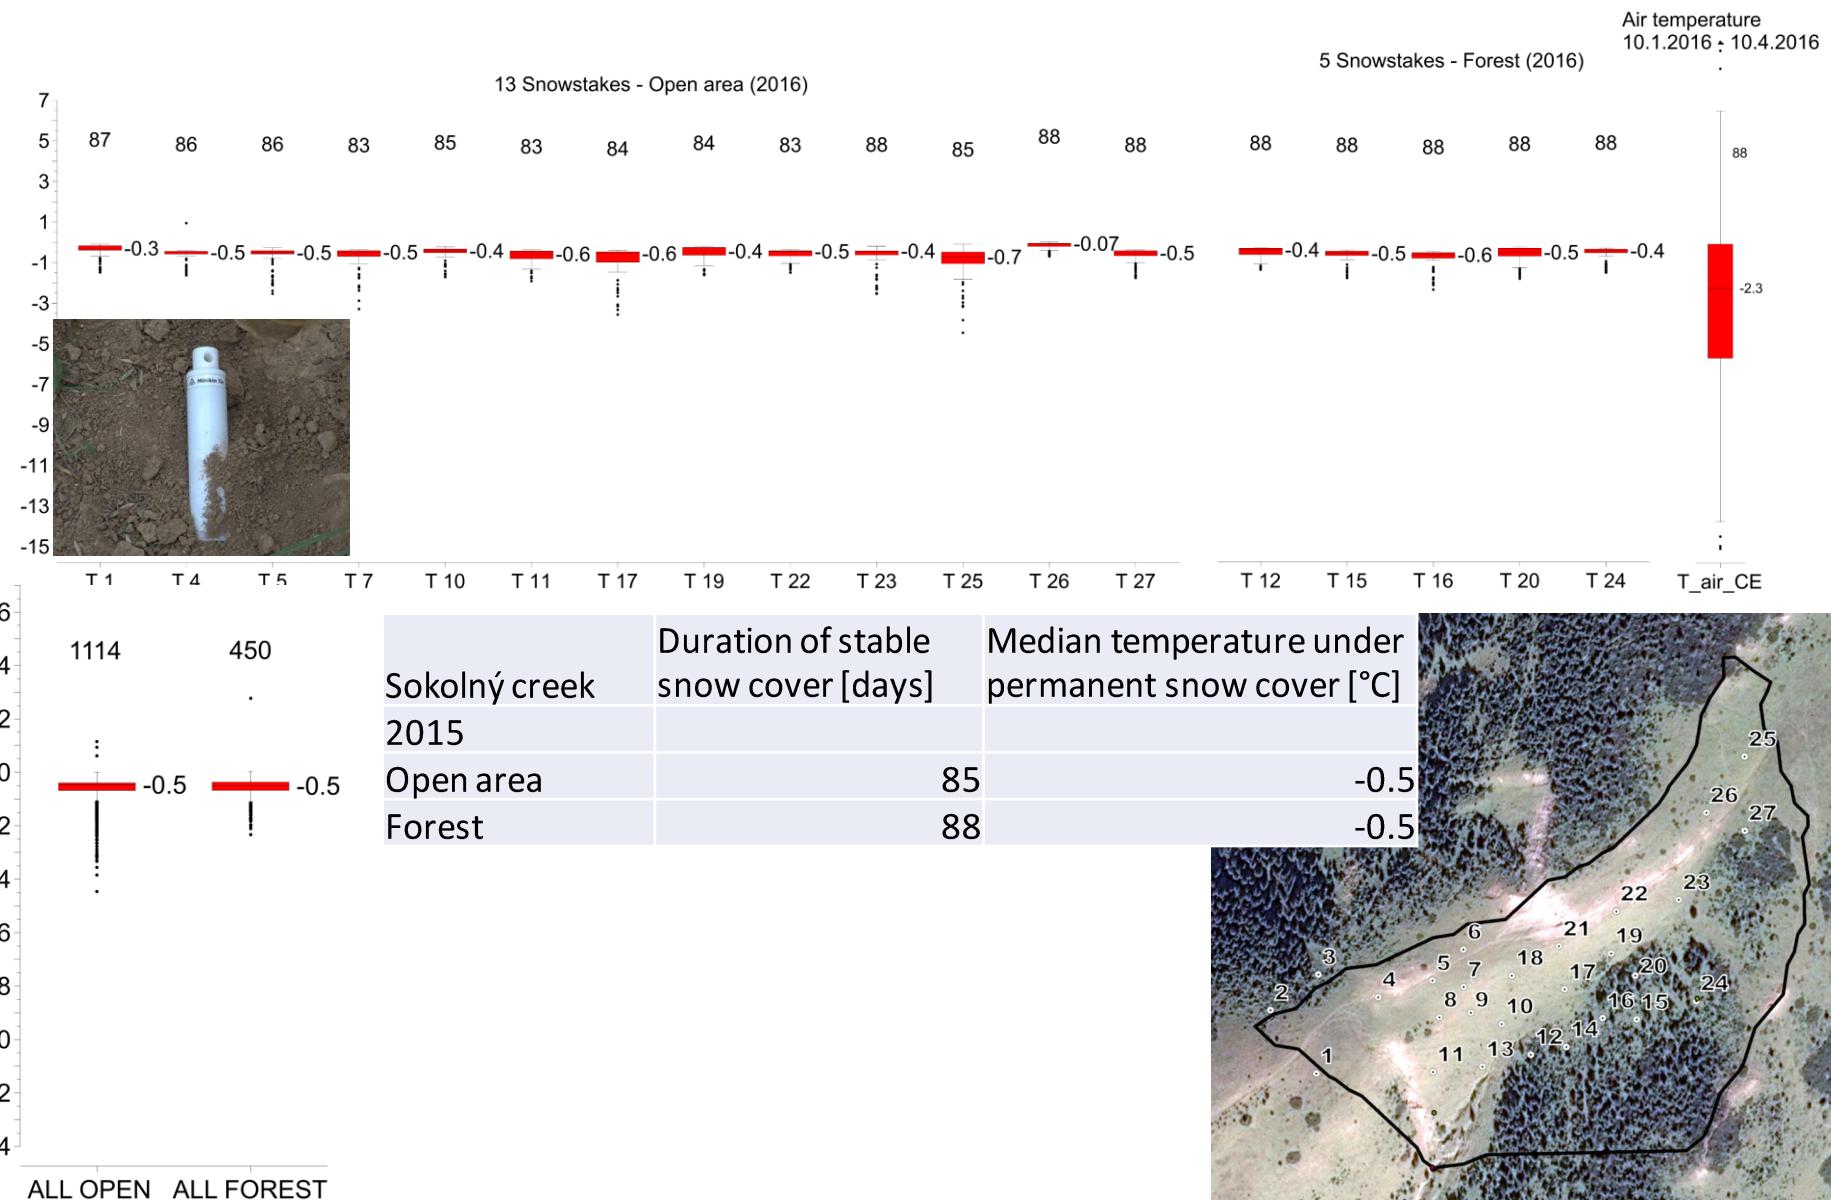

surface temperature of the soil at snow stakes under permanent snow cover at snow stake no. 16

Duration of stable snow cover in winter 2015

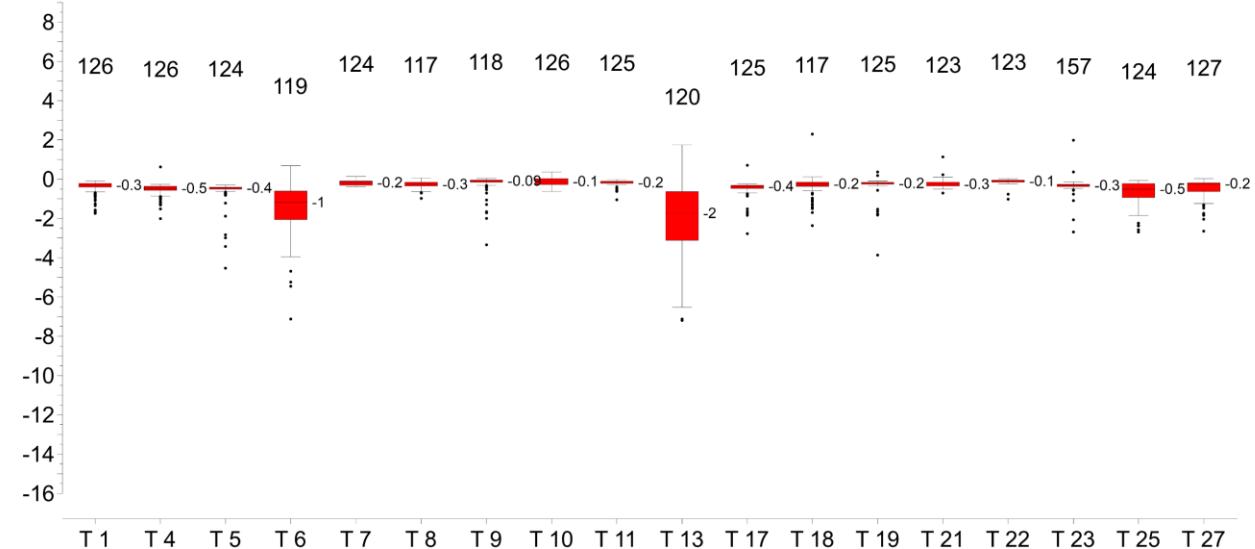

Duration of stable snow cover 2016

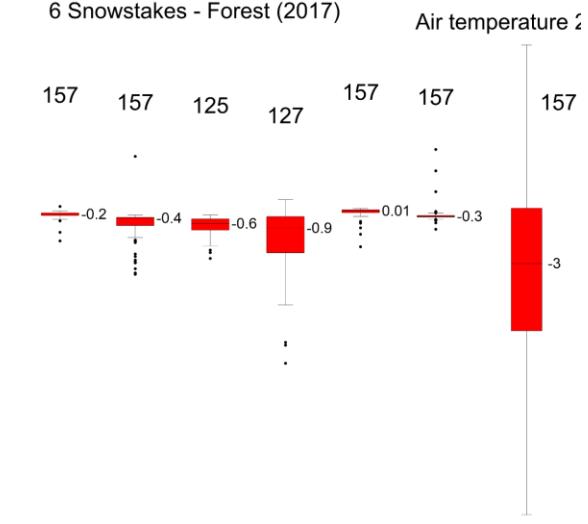

Duration of stable snow cover 2017

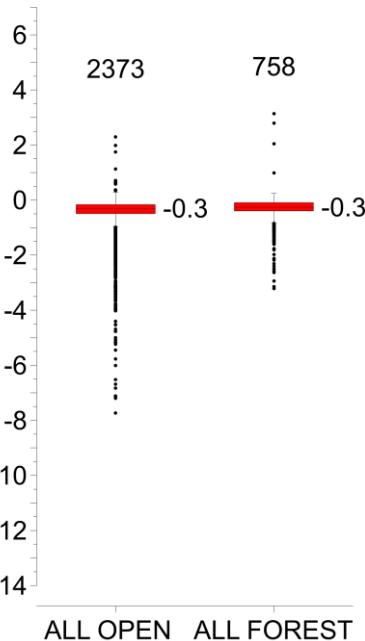

13 Snowstakes - Open area (2017)

6 Snowstakes - Forest (2017)

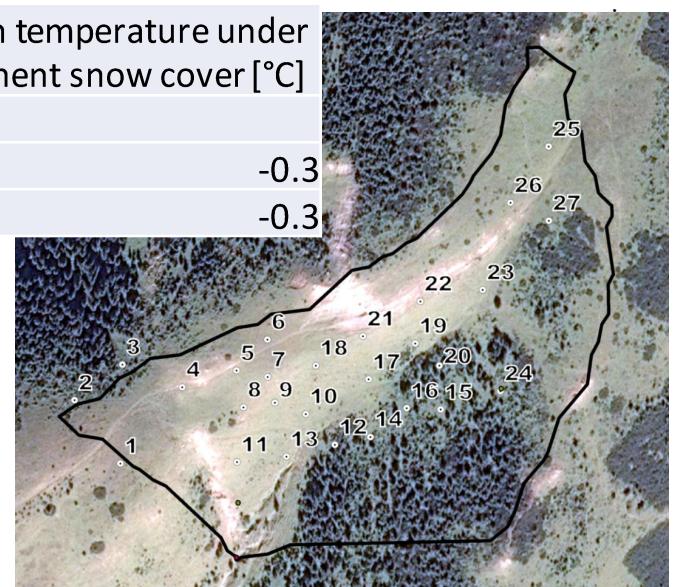

Air temperature 2

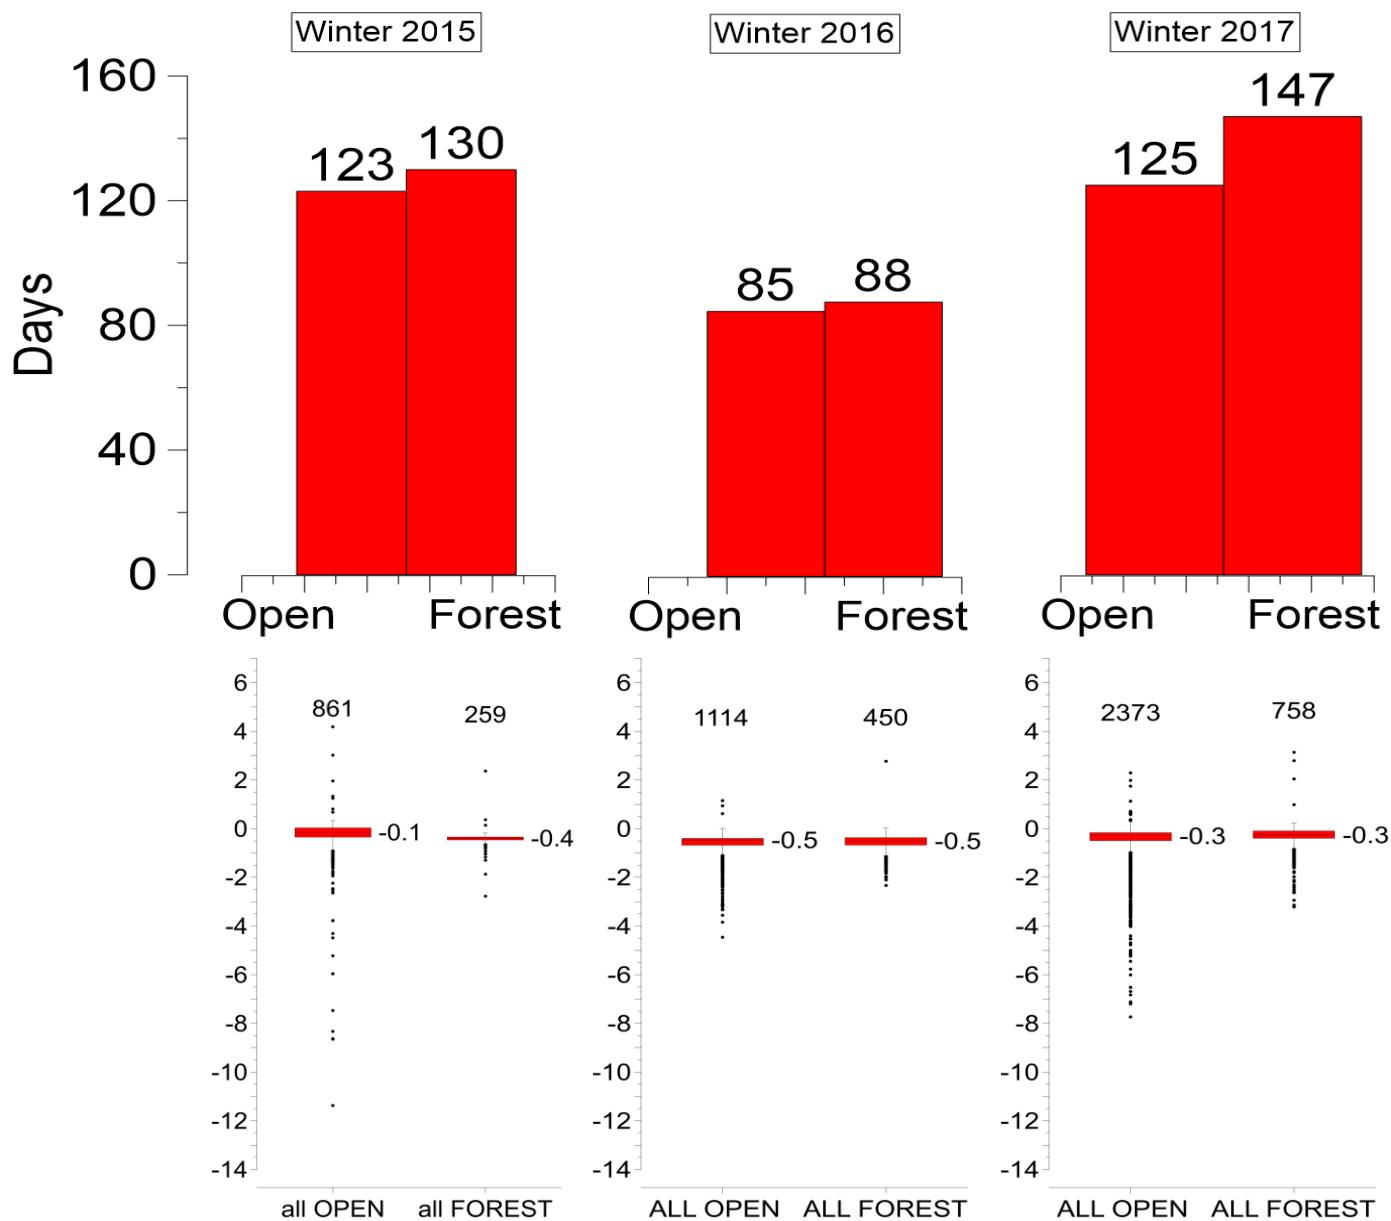

Sokolný creek
2015
Open area
Forest

Duration of stable
snow cover [days]

Median temperature under
permanent snow cover [°C]

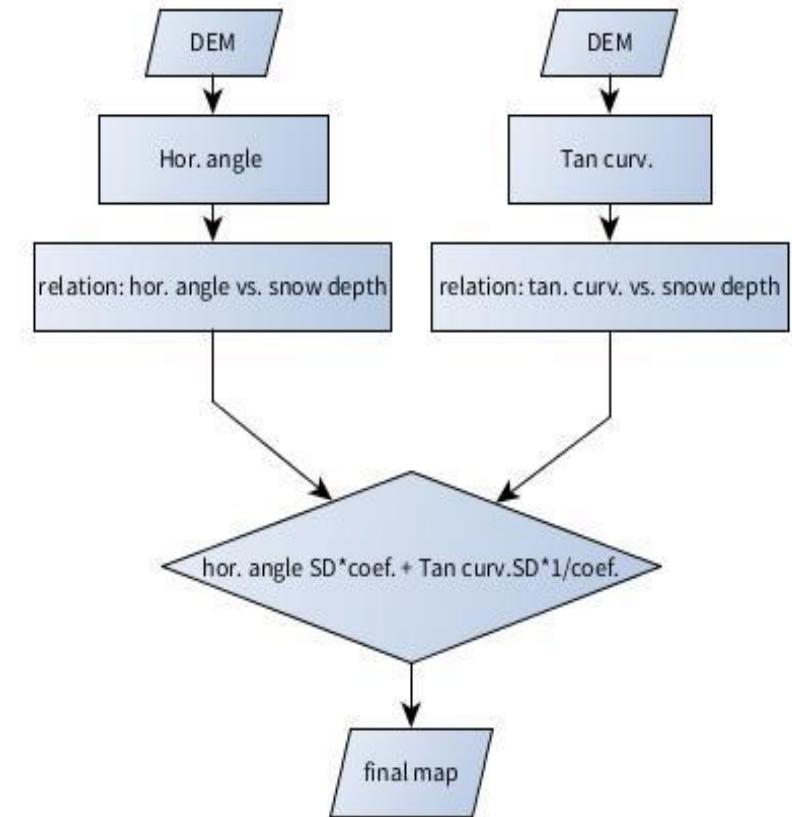

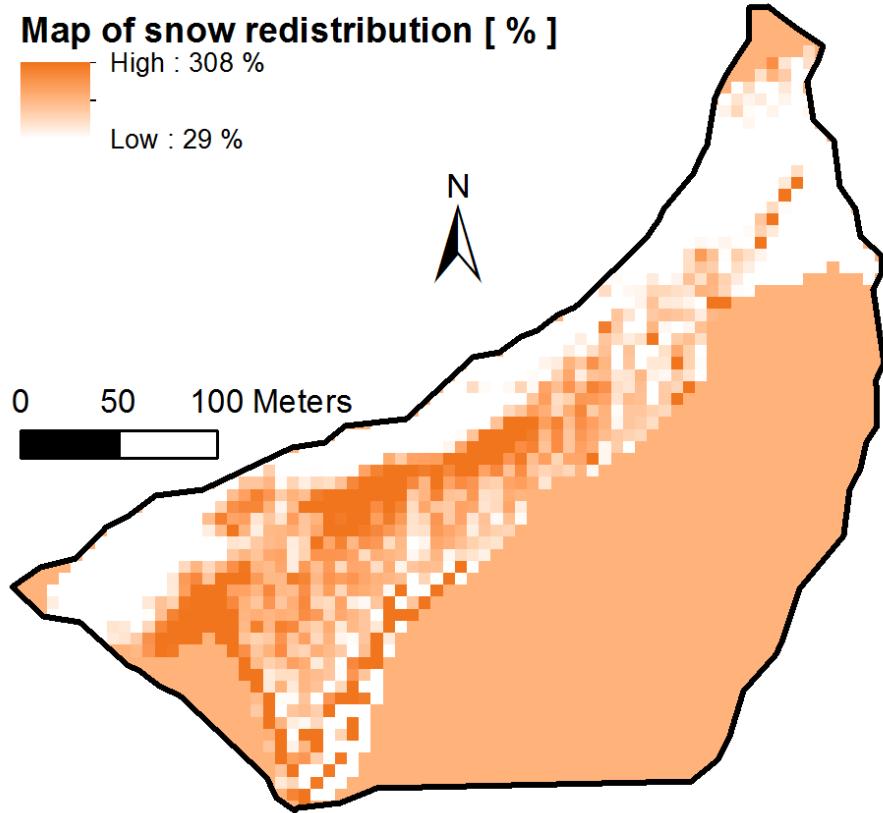

Duration of stable snow cover 2015 – 2016 - 2017

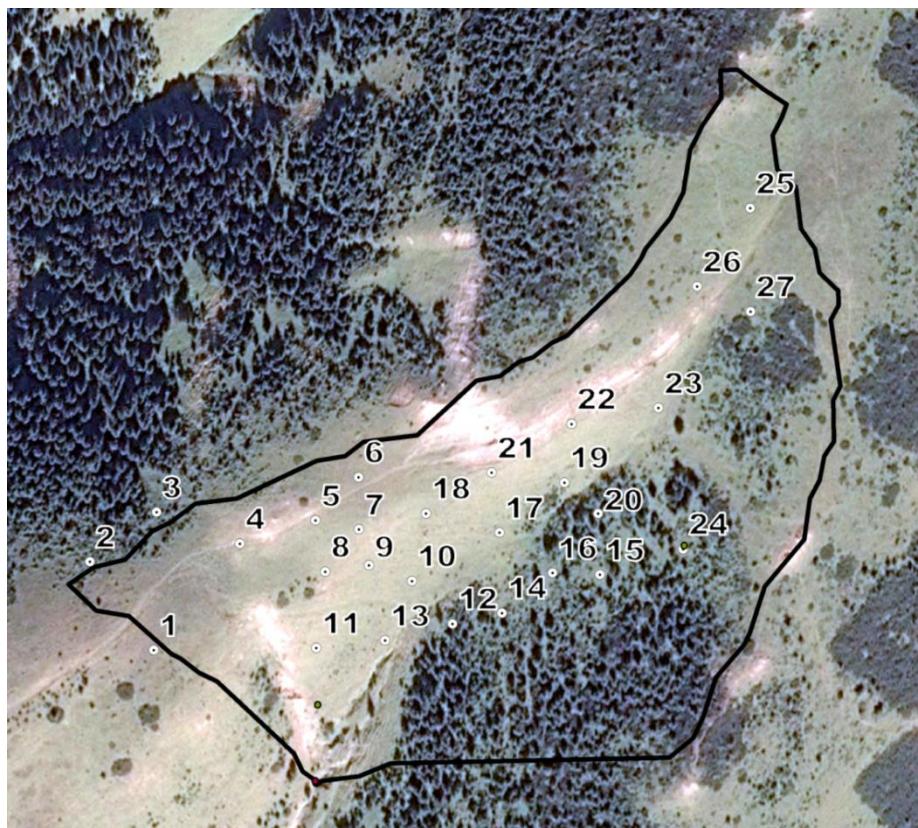

Hydrological model Mike SHE – Spatially distributed snow accumulation and melt

Snow redistribution by the wind

Construction of the precipitation redistribution map based on snow depth (2016) and terrain morphometric data

Construction of the radiation melting coefficient map (software Solei32 - Meszároš, 1998)

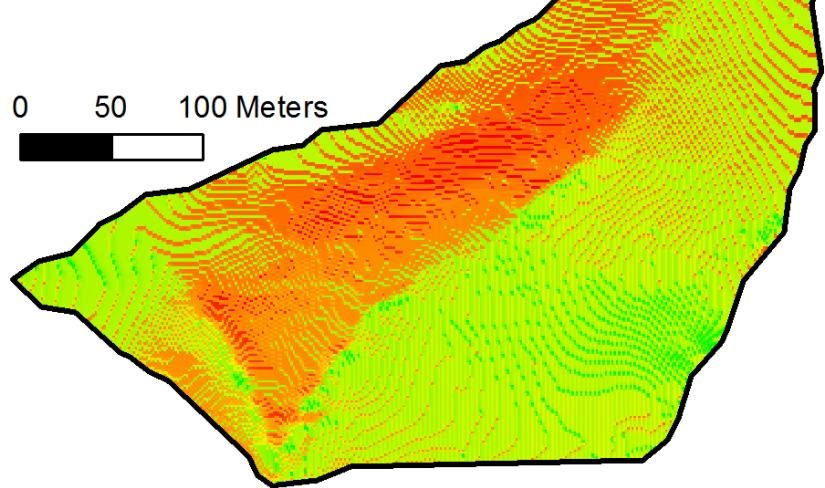

Radiation Melting Coefficient [kJ/m²/hour]

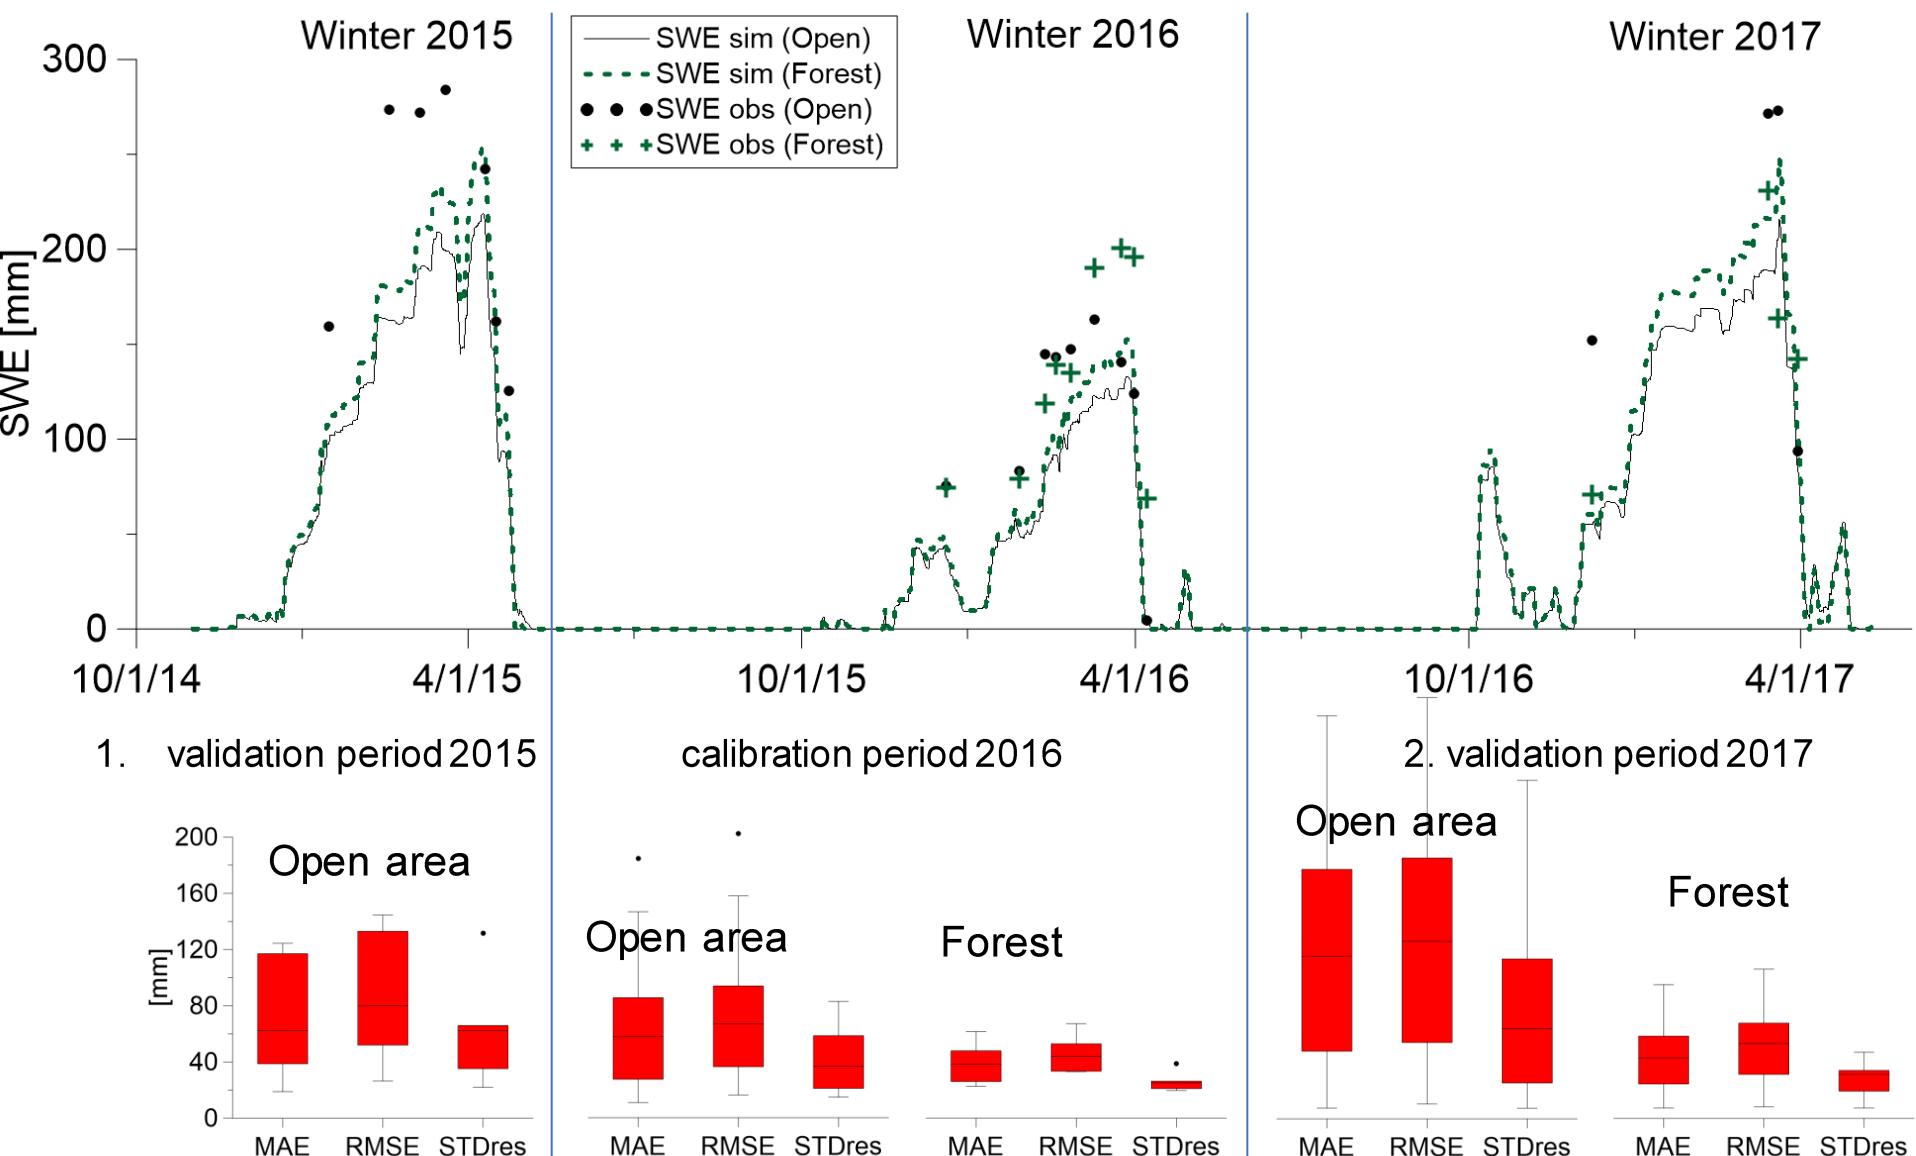

High : 1.32e-13

Low : 1.61e-14

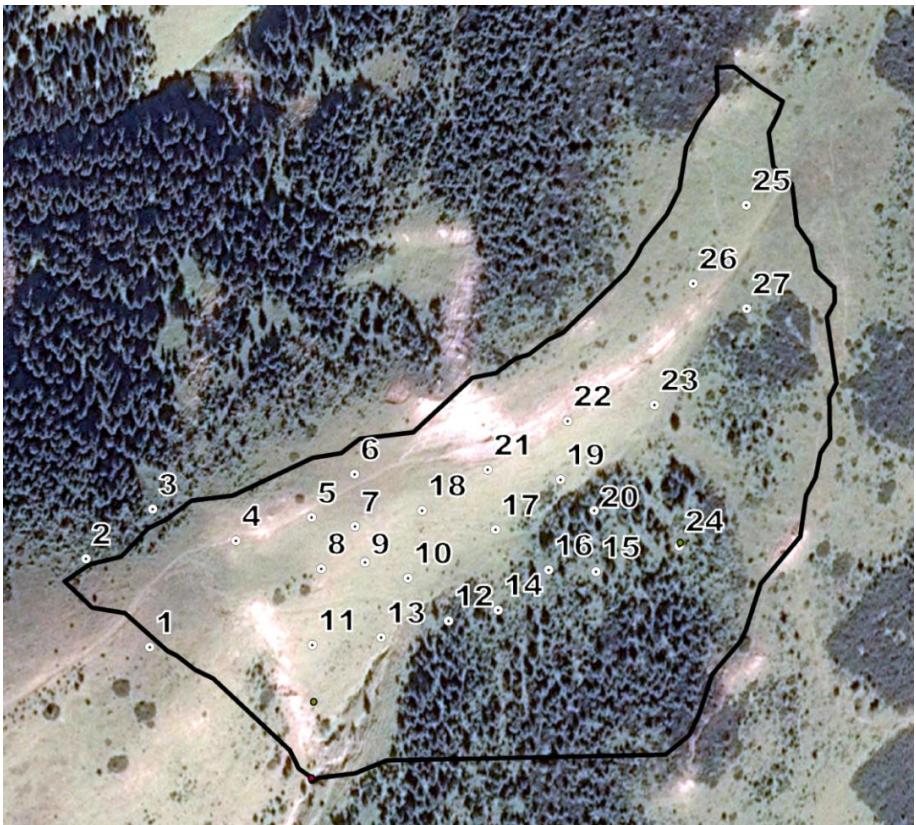

0 50 100 Meters

Results

Calibration period – Winter 2016

19 Snow stakes (Open area)

Nash-Sutcliffe > 0.35 **OK / wrong**
6 / 13

RMSE < 70

12 / 7

R(corr) > 0.5

14 / 5

6 Snow stakes (Forest)

Nash-Sutcliffe > 0.35 **OK / wrong**
3 / 3

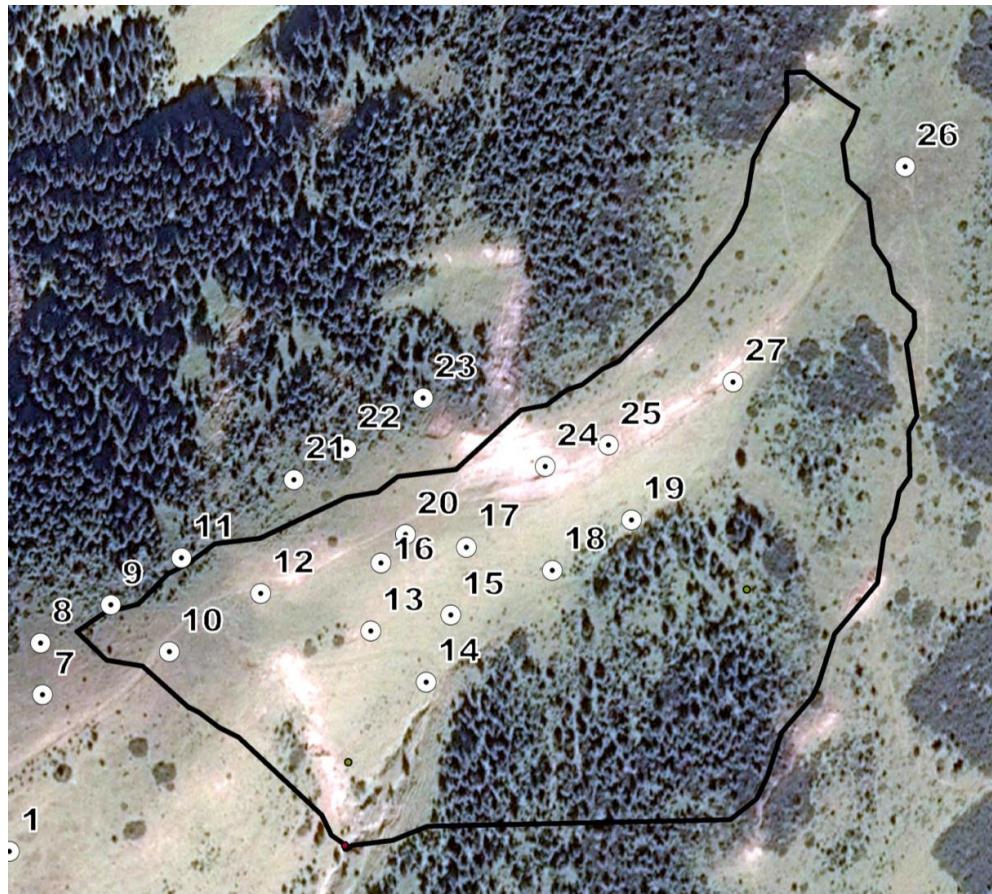

RMSE < 70

6 / 0

R(corr) > 0.5

6 / 0

1. Validation period – Winter 2015

13 Snow stakes

Nash-Sutcliffe > 0.35

OK / wrong

9 / 4

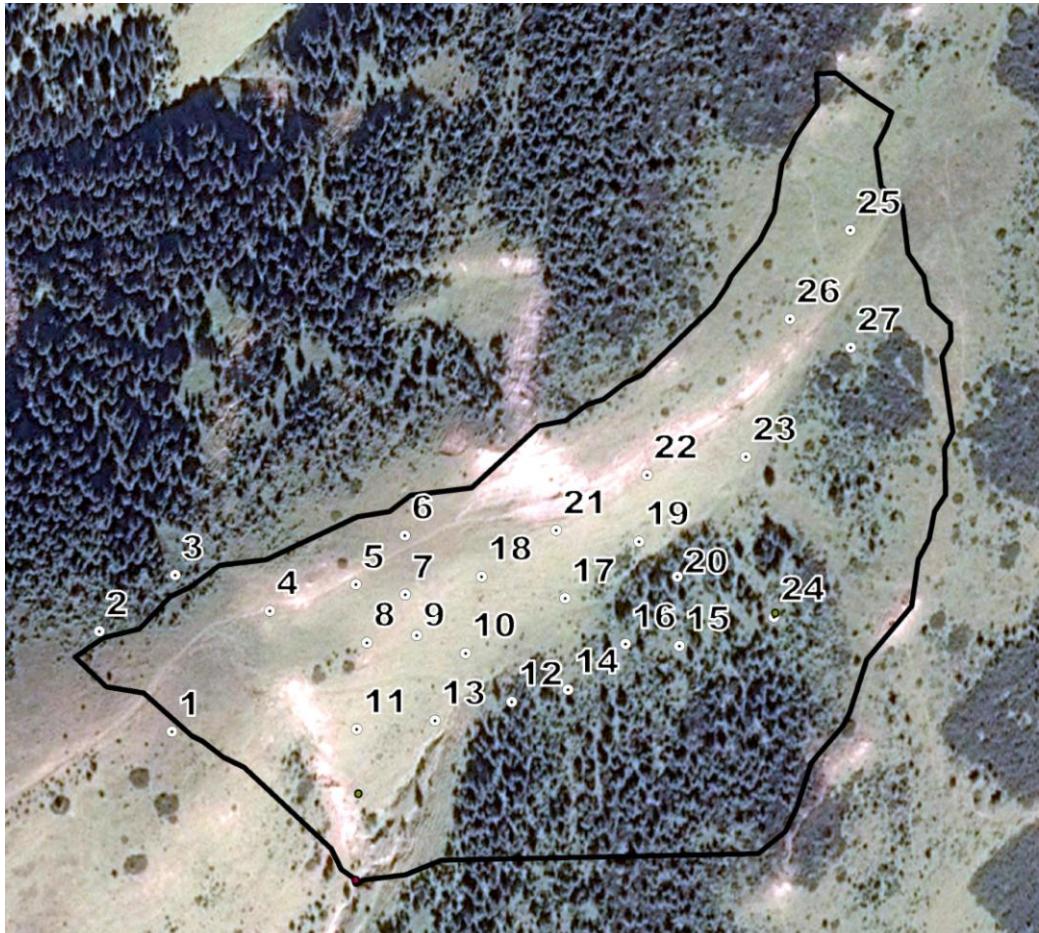

RMSE < 70

7 / 6

R(corr) > 0.5

13 / 0

2. Validation period – Winter 2017

19 Snow stakes (Open area)

Nash-Sutcliffe > 0.35

OK / wrong

3 / 16

RMSE < 70

5 / 14

R(corr) > 0.5

17 / 2

6 Snow stakes (Forest)

Nash-Sutcliffe > 0.35

OK / wrong

1 / 5

RMSE < 70

5 / 1

R(corr) > 0.5

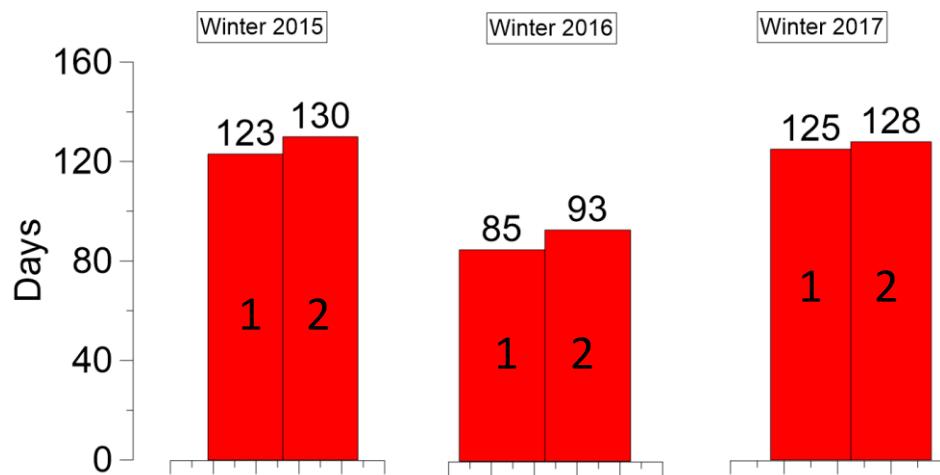

6 / 0

Comparison duration of stable snow cover 2015 – 2017 in days between:

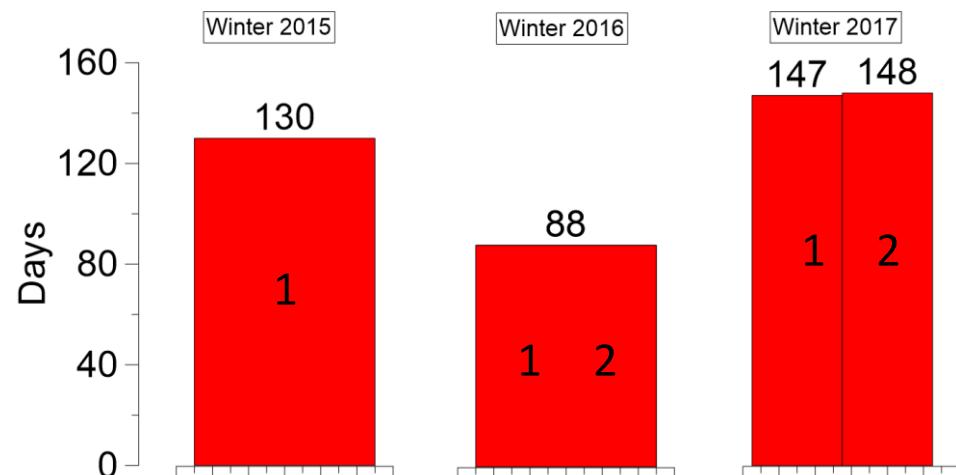

1. Soil surface thermometers (Open area and forest)
2. Mike SHE model (Open area and forest)

Open area

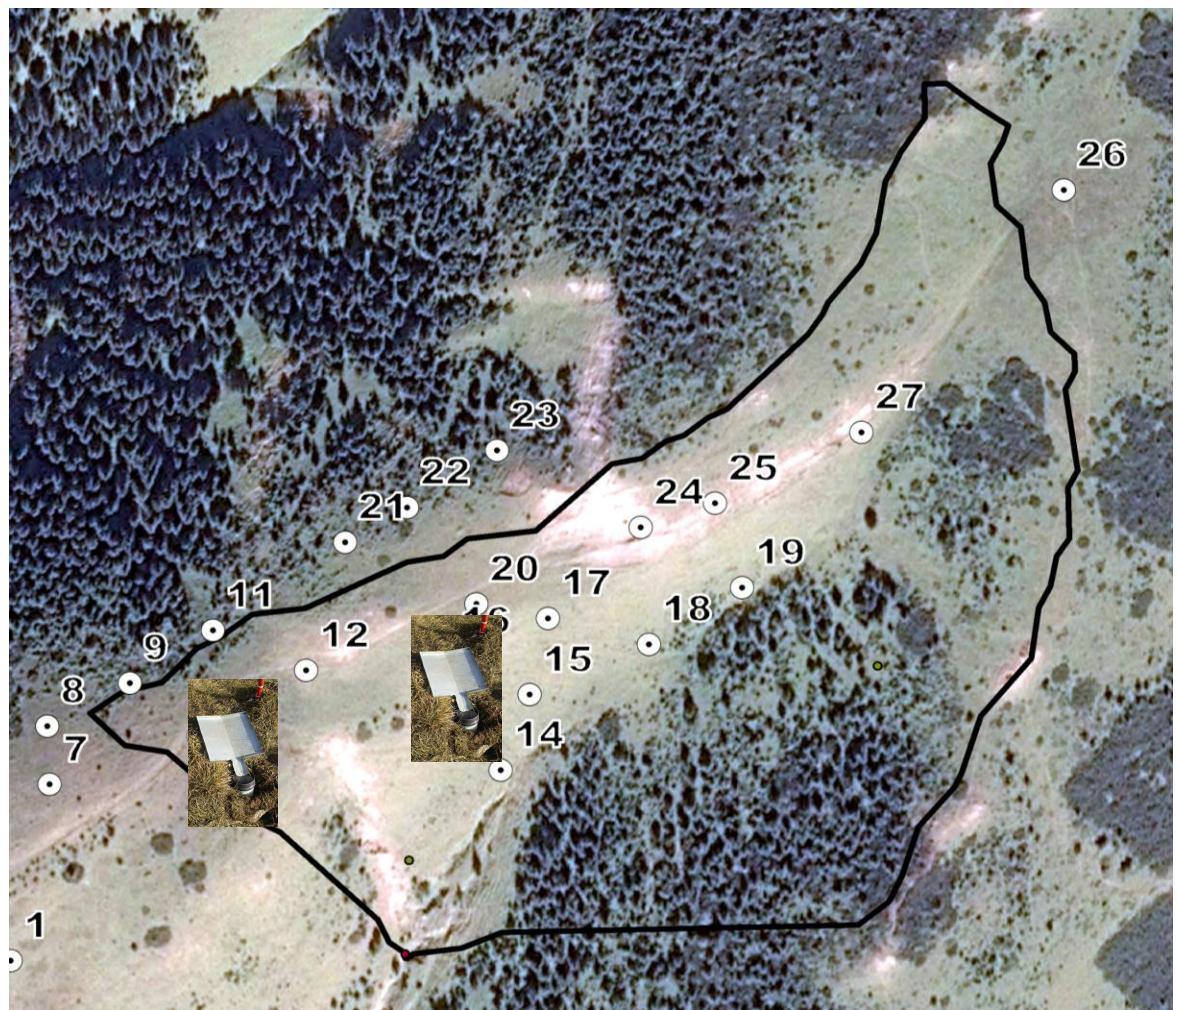

Forested part

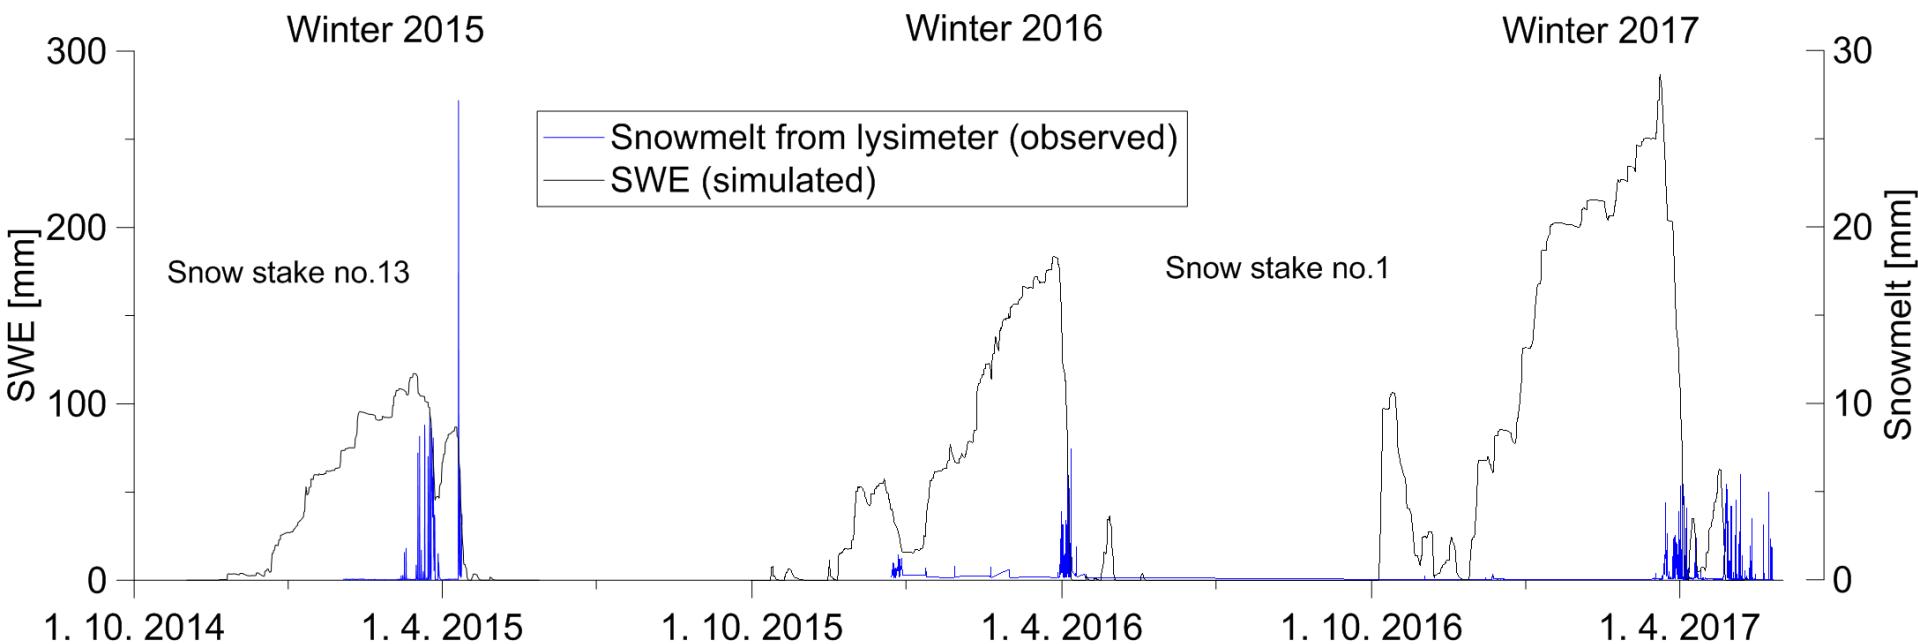

Comparison of snowmelt from lysimeters

1. Lysimeters at snow stake no. 13 in Winter 2015
2. Lysimeters at snow stake no. 1 in Winter 2016-2017

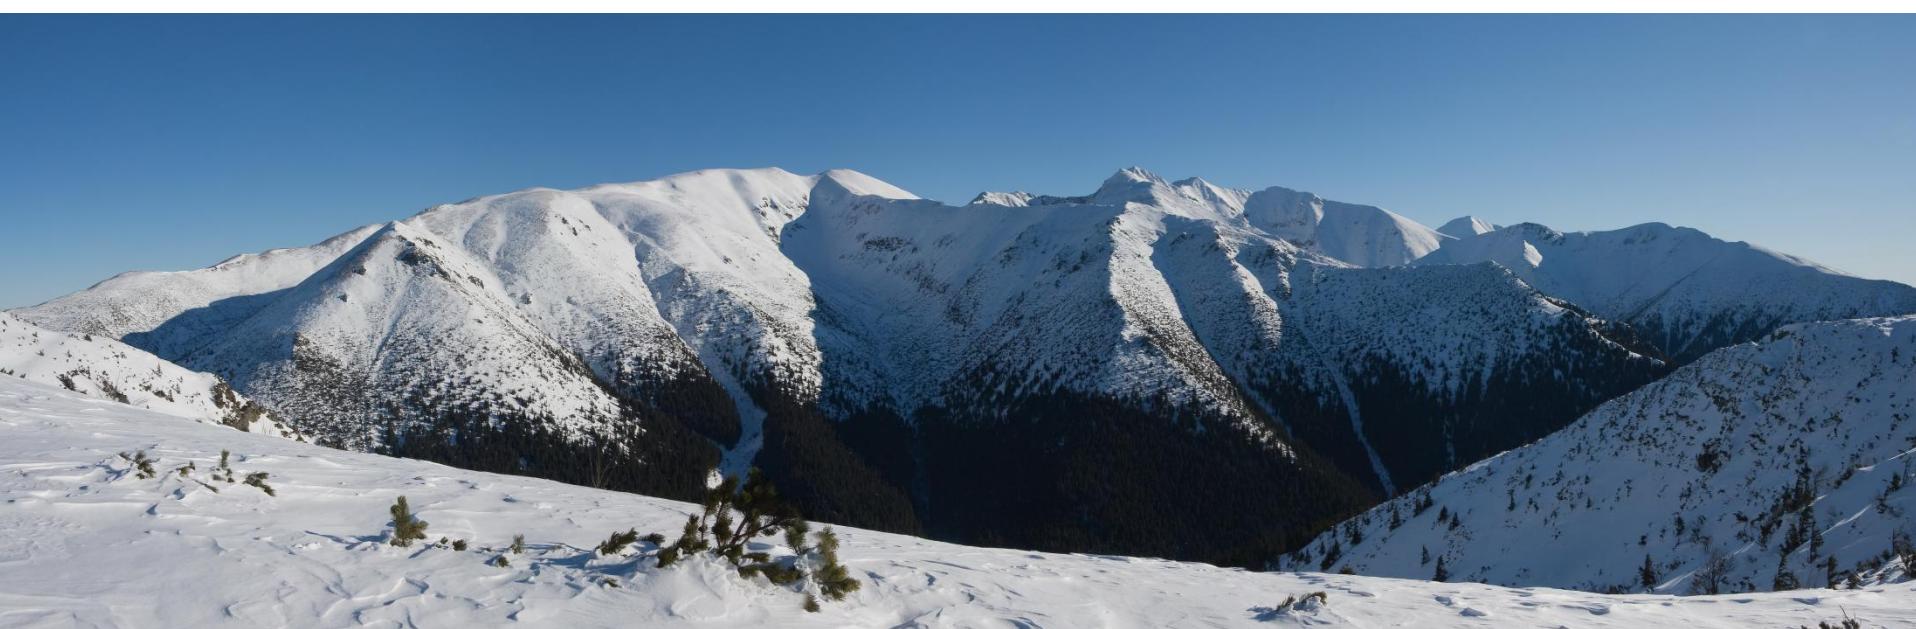

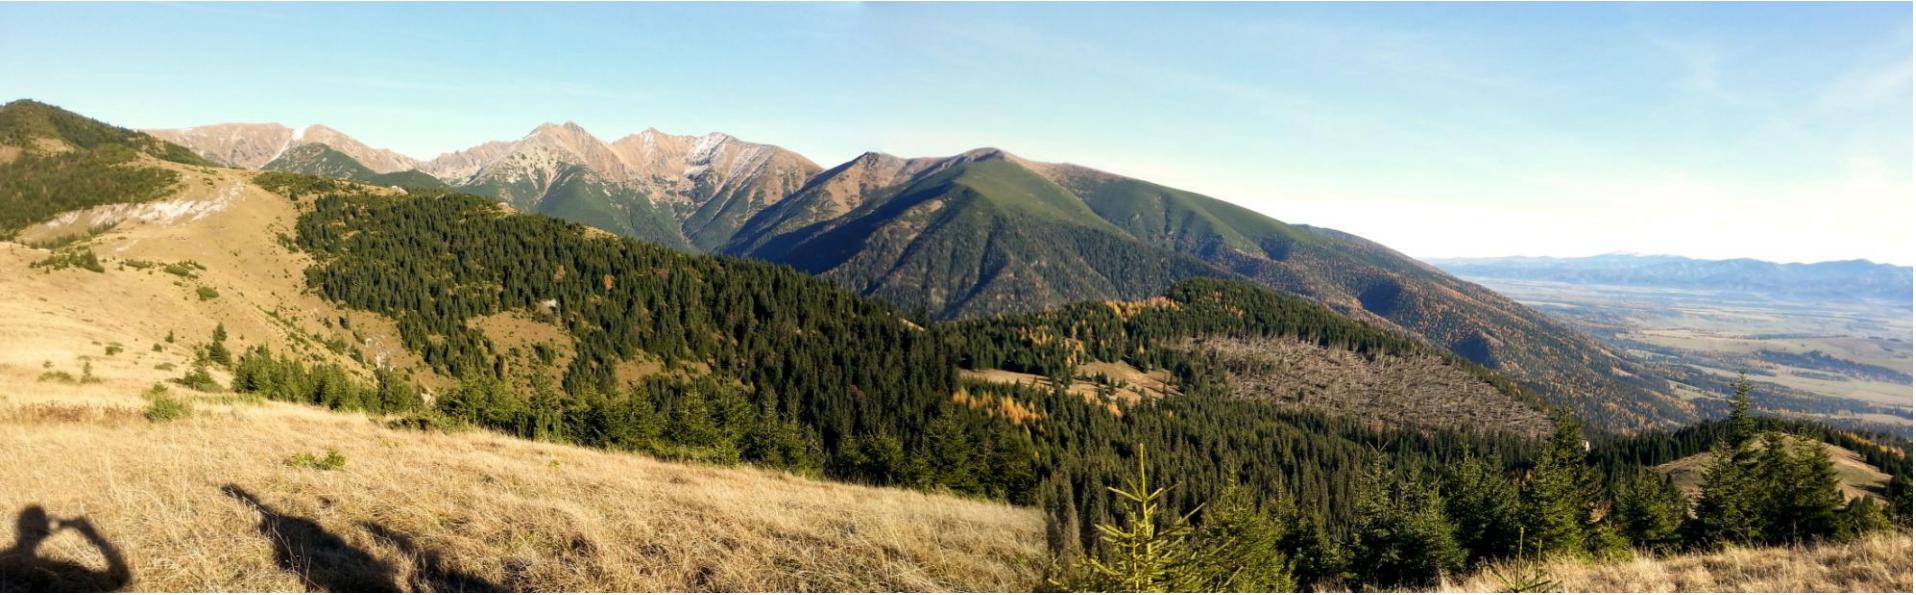

Comparison of snowmelt from lysimeters

1. Lysimeters at snow stake no. 13 in Winter 2015
2. Lysimeters at snow stake no. 1 in Winter 2016-2017

Conclusions

1. Snow variability in the mountain basin is large in the open area and minimal in the forest
2. The low variability of snow density was confirmed
3. Surface thermometers are useful for determining the duration of stable snow cover
4. Duration of stable snow cover in the forest was longer than on the open area
5. The precipitation redistribution map is applicable
6. Simulated snowmelt are comparable to measured by lysimeters

Thanks you for your attention
